

ITZFENYXZ EDITOR

Indexed Transform Zone File - Entity Node YIXIZ

Recovered 3D model editing and game model updates.

Noema Interactive

Program Function

ITZFENYXZ Editor opens recovered 3D models in **.3ds** format. It lets you change the model root, the visible Geometry and the Box Collider.

Your changes are exported as specific update notes inside an **.itzfenyxz** file. When the game reads that file, the corresponding model receives the new data in real time. The process is presented as taking a 3D model out of the game, inserting new data and returning an updated version.

Object Parts

Part	Function
Object Root	Moves, rotates or scales Geometry and Collider together.
Geometry	The visible mesh. It can be transformed or removed.
Box Collider	The physical box. It can be transformed or removed separately.

Basic Workflow

- 1 Open the recovered .3ds model.
- 2 Select Object Root, Geometry or Box Collider.
- 3 Use Move, Rotate, Scale or the numeric Inspector fields.
- 4 Save the result as .itzfenyxz.
- 5 Place the update file in the game model folder and let the game read the new data.

Controls and Shortcuts

Shortcut	Action
Ctrl + O	Open .3ds or .itzfenyxz
Ctrl + S	Save
Ctrl + Shift + S	Save As
Ctrl + Z	Undo
Ctrl + Shift + Z / Ctrl + Y	Redo
G	Move
R	Rotate
S	Scale
X / Y / Z	Restrict the active tool to one axis
0	Free movement or uniform scale
Left mouse drag	Apply the active transform
Right mouse / Esc during drag	Cancel the current transform
Shift while dragging	Precision mode
Ctrl while dragging	Snap
Delete	Remove the selected Geometry or Collider
F	Frame the model
1 / 3 / 7	Front / Right / Top view
C	Show or hide the Collider
Right mouse drag	Orbit camera
Shift + right mouse drag	Pan camera
Mouse wheel	Zoom

Files

.3ds is the recovered model used as the editing source. **.itzfenyxz** is the update file containing the new model data.
